

UI-UX

4 method discussion

Md Abdul Wazed

Project: Dingdong

Task 1:

Feature Prioritization Using Kano Analysis

Objective

To prioritize platform features based on their impact on user satisfaction and business value.

Method

Using Kano Analysis, features are classified into three categories:

- Basic features (Must-have)
- Performance features (More is better)
- Delight features (Unexpected value)

Application to My Project

List of Main Features

- | | |
|--|--|
| <ul style="list-style-type: none">• User registration & verification• Service search and filters• Task posting• Ratings & reviews | <ul style="list-style-type: none">• In-app chat• Background verification badge• Real-time job tracking |
| <p><u>Basic Features (Must-have):</u></p> | <ul style="list-style-type: none">• Secure login• Payment system• Job posting |

- Search functionality

Users expect:

- Safe login
- Ability to post jobs
- Ability to search services
- Ability to evaluate freelancers
- Secure payments

Performance Features:

- Advanced filters
- Fast messaging
- Availability calendar
- Detailed freelancer profiles

Users expect:

- Faster comparison
- Better communication
- Clear availability
- More transparency

Delight Features:

- Instant booking
- Verified badge display
- Smart price suggestions
- Job progress tracking
- Booking function in nearest service shop

These features may increase....

- Trust
- Convenience
- Professional perception
- Competitive advantage

Reflection on Resource Allocation

Are too many resources spent on basic features?

In early development phases, significant effort is naturally spent on:

- Authentication
- Backend Development
- Payment integration
- Security
- Compliance

This is necessary because without these, the platform cannot operate.

However, over-optimizing basic features beyond reliability may result in diminishing returns, since users simply expect them to work.

Basic features should be:

- Reliable
- Secure
- Simple, But not over-engineered.

Where Could Small Effort Produce High Satisfaction?

Delight features often require relatively small implementation effort but can generate high perceived value.

Examples:

- Adding a “Verified” badge indicator
- Showing estimated response time
- Clear job status indicators
- Smart price recommendation tool

These features:

- Improve emotional experience
- Increase trust
- Strengthen brand differentiation

A small visual or functional enhancement can significantly improve perceived quality.

From the Kano analysis:

1. Basic features must be implemented first to ensure platform viability.
2. Performance features should be optimized gradually to increase retention.
3. Select delight features should be strategically added to create competitive advantage.

Task 2:

Jobs To Be Done (JTBD) Analysis

Defined Core User Jobs

Customer Job Statement

- ⇒ When I need a household service,
- ⇒ I want to quickly find and hire a reliable freelancer,
- ⇒ So I can solve my problem safely and without stress.

Freelancer Job Statement

- ⇒ When I want to earn flexible income,
- ⇒ I want to find nearby service requests easily,
- ⇒ So I can secure paid work efficiently.

Identify Job Dimensions

Functional Goals

- Post tasks
- Compare freelancers
- Secure payment
- Receive payout

Emotional Drivers

- Feel safe during payment
- Trust freelancer qualifications
- Avoid scams or disputes

Social

Considerations

- Maintain high ratings
- Appear professional and reliable

Evaluate Design Alignment

Current design supports:

- Secure escrow payments → supports safety
- Ratings & reviews → supports trust
- Profile verification → supports credibility

Potential improvement:

- Clearer job status updates to reduce anxiety
- More transparent cancellation rules

Conclusion

JTBD analysis ensures the platform focuses on solving real user problems rather than simply adding features.

It highlights that trust and security are as important as functionality in this marketplace context.

Task 3:

Heuristic Evaluation (Nielsen's Principles)

Objective

To systematically evaluate the interface using established usability principles.

Heuristics Applied

- Visibility of system status
- Match between system and real-world language
- User control and freedom
- Error prevention
- Consistency and standards

Key Evaluation Results

Visibility of System Status

Job status must always be visible:

- Open
- Assigned
- In Progress
- Completed
- Disputed

Lack of status clarity will reduce trust of the user.

User Control and Freedom

Users must:

- Cancel before confirmation
- Edit task before publishing
- Access dispute process easily

Error Prevention

- Payment confirmation required before processing
- Clear validation messages in forms

Consistency

- Same button style for all primary actions
- Consistent terminology (e.g., "Freelancer" not mixed with "Provider")

Conclusion

The heuristic review identified structural usability risks and ensured the interface follows recognized usability standards rather than subjective preference.

Task 4:

Accessibility Assessment

Objective

To evaluate whether the platform is usable by users with diverse abilities and meets inclusive design principles.

Areas Evaluated

1. Text and Visual Contrast

- Ensure sufficient contrast ratio.
- Avoid light grey text on white backgrounds.

2. Form Accessibility

- All inputs clearly labeled.
- Error messages specific and understandable.

3. Keyboard Navigation

- Users can navigate forms without mouse.
- Focus states visible.

4. Feedback and Error Recovery

- Clear payment failure explanation.
- Easy retry options.

Identified Accessibility Risks

- Long forms may overwhelm users with cognitive limitations.
- Icons without text labels may reduce clarity.
- Small clickable areas may affect motor-impaired users.

Improvement Recommendations

- Increase button size.
- Add text labels under icons.
- Simplify task-posting form.
- Use plain language for instructions.

Conclusion

Accessibility assessment improves usability for all users, increases inclusivity, and aligns with European digital standards. Addressing accessibility early reduces long-term redesign costs.
